Epidemiology of HIV Among Blacks Reported in Florida, Through 2014
HIV and AIDS Case Data

- Adult cases represent ages 13 and older, pediatric cases are those under the age of 13. For data by year, the age is by age of diagnosis. For living data, the age is by current age at the end of the most recent calendar year, regardless of age at diagnosis.
- Unless otherwise noted, whites are non-Hispanic and blacks are non-Hispanic.
- Total statewide data will include Department of Correction Cases (DOC) unless otherwise noted. County data will exclude DOC cases.
- HIV prevalence data are generated later in the year, usually in July, when most of the “expected” death data are complete.

Rates of Diagnoses of HIV Infection among Adult and Adolescent Blacks/African Americans, 2013—United States

N = 21,714  Total Rate = 68.2

Note. Data include persons with a diagnosis of HIV infection regardless of stage of disease at diagnosis. All displayed data have been statistically adjusted to account for reporting delays, but not for incomplete reporting.

Adult HIV Case Rates*
Among Blacks, by County of Residence**, Reported in 2014, Florida

Statewide Data among Blacks:
N=2,478
State Rate among Blacks= 102.3
Rate per 100,000 Population

*Population data are from Florida CHARTS
**County totals exclude Department of Corrections cases (N=85).
Adult AIDS Case Rates*
Among Blacks, by County of Residence**, Reported in 2014, Florida

Statewide Data among Blacks:  
N=1,384  
State Rate Among Blacks= 57.1  
Rate per 100,000 Population

*Population data are from Florida CHARTS  
**County totals exclude Department of Corrections cases (N=37).
Pediatric HIV Infection Cases and State Population**
in Children <13 years of age, by Race/Ethnicity, Diagnosed through 2014, Florida

**Source: Population estimates are provided by Florida CHARTS as of 7/9/2015.

Note: Over the past ten years, HIV infection cases decreased among blacks by 25% and among whites by 2%. In contrast, there was a 16% increase in HIV infection cases among Hispanics during this same period.

*Other includes American Indian/Alaska Native, Asian/Pacific Islander, and multi-racial.

Note: Over the past ten years, black men represented the highest proportion (> 35%) of male HIV infection cases by race/ethnicity. From 2005 to 2014, the percentage of male HIV cases increased by 5 percentage points among Hispanics and 1 percentage point among whites. In contrast, the HIV cases decreased by 6 percentage points among blacks over the same time period.

*Other includes American Indian/Alaska Native, Asian/Pacific Islander, and multi-racial.
Adult Female HIV Infection Cases, by Race/Ethnicity, and Year of Report, 2005–2014, Florida

Note: HIV case disparities are more evident among women than men. For the past ten years, black women represented over 63% of the cases each year. From 2005 to 2014, the proportion of cases by race/ethnicity among women remained fairly stable.

*Other includes American Indian/Alaska Native, Asian/Pacific Islander, and multi-racial.
Adult HIV Infection and AIDS Cases Reported in 2014 and Population, by Race/Ethnicity, Florida

Note: Blacks comprise only 14% of the adult population in Florida, but represent 41% of adult HIV infection cases and 52% of adult AIDS cases reported in 2014. Similarly, Hispanics comprise 23% of Florida’s adult population, yet account for 26% of the HIV infection cases and 20% of the AIDS cases.

*Source: Population estimates are provided by Florida CHARTS as of 7/9/2015.

**Other includes Asian/Pacific Islanders, Native Alaskans/American Indians and multi-racial individuals.
Similar to AIDS, black men and to an even greater extent, black women are over-represented in the HIV epidemic. The HIV case rate for 2014 is 4 times higher among black men than the rate among white men. Among black women, the HIV case rate is 13-fold greater than the rate among white women. Hispanic male and female HIV case rate is higher than the rate among their white counterparts.

*Source: Population estimates are provided by Florida CHARTS as of 7/9/2015.
Note: In this snapshot of 2014, HIV cases by race/ethnicity among males is more evenly split compared to HIV cases among females where blacks are over-represented, accounting for 62% of adult cases among women.
*Other includes Asian/Pacific Islanders, Native Alaskans/American Indians and multi-racial individuals.
Definitions of Mode of Exposure Categories

- **MSM** = Men who have sex with men or Male-to-male sexual contact with person with HIV/AIDS or known HIV risk
- **IDU** = Injection Drug User
- **MSM/IDU** = Men who have sex with men or Male-to-male sexual contact & Injection Drug User
- **Heterosexual** = Heterosexual contact with person with HIV/AIDS or known HIV risk
- **OTHER** = includes hemophilia, transfusion, perinatal, other pediatric risks and other confirmed risks.
- **NIR** = Cases reported with No Identified Risk
- **Redistribution of NIRs** = This illustrates the effect of statistically assigning (redistributing) the NIRs to recognized exposure (risk) categories by applying the proportions of historically reclassified NIRs to the unresolved NIRs.
HIV Infection Cases
Among Adult Black Males, by Mode of Exposure and Year of Report, 2005–2014, Florida

Note: NIRs redistributed. In more recent years, male-to-male sexual contact (MSM) remained as the primary mode of exposure among black male HIV cases in Florida, followed by heterosexual contact.

Note: NIRs redistributed. The heterosexual risk continues to be the dominant mode of exposure among black females.
Cases Living with HIV Disease

Unless otherwise stated, data in the following slides represent cases living with HIV Disease, also referred to Persons Living with HIV/AIDS (PLWHAs), who were reported through the most recent calendar year. Living data are also referred as prevalence cases.

HIV prevalence data are generated later in the year, usually in May, when most of the “expected” death data are complete.

Adult cases represent ages 13 and older, pediatric cases are those under the age of 13. For data by year, the age is by age of diagnosis. For living data, the age is by current age at the end of the most recent calendar year, regardless of age at diagnosis.

Unless otherwise noted, whites are non-Hispanic and blacks are non-Hispanic.

Total statewide data will include Department of Correction Cases (DOC) unless otherwise noted. County data will exclude DOC cases.

HIV Mortality in Florida

Resident HIV deaths due to HIV disease represent persons who resided in Florida and whose underlying cause of death was HIV disease, regardless if they were reported with HIV disease in Florida or not.
- The data source is death certificate data from the Florida Department of Health, Office of Vital Statistics.

HIV case deaths are known cases of HIV disease (regardless of AIDS status) reported in Florida and are known to be dead, regardless of the cause of death. It is important to understand if any known HIV/AIDS cases died in any given year for estimates of the current burden of HIV/AIDS care and treatment needs within the state.
- The data source is the Florida HIV/AIDS Reporting System (eHARS) from the Florida Department of Health, HIV/AIDS Section.

Selected slides from the Florida Deaths Slide Set, see site below for entire set.
There was a 6% decrease in total resident death due to HIV from 2013 to 2014. A similar trend was seen among blacks where there was a 20% decrease in deaths due to HIV in the same period.

*Source: Florida Department of Health, Bureau of Vital Statistics, Death Certificates (as of 05/31/2015).
Resident Deaths* Due to HIV Disease, by Race/Ethnicity and Year of Death, 2005-2014, Florida

Note: Over the past ten years, the proportional distribution of resident HIV deaths due to HIV by race/ethnicity has remained fairly level. In 2014, the proportional distribution by race/ethnicity was: 27% among whites, 57% among blacks, 12% among Hispanics.

*Source: Florida Department of Health, Bureau of Vital Statistics, Death Certificates (as of 05/31/2015).
Rate* of Resident Deaths** due to HIV Disease, by Sex and Race/Ethnicity, 2014, Florida

Note: In 2014, black males were nearly 6 times more likely than white males to die of HIV disease. The HIV disease death rate among black females was 17-fold greater than the rate among white females. Hispanic females rate were slightly higher than the rate among their white counterpart. Hispanic males rate were equivalent to the rate among their white counterpart.

Note: Survival times increased for all race/ethnicity groups with the introduction of AZT in 1987. With the introduction of Highly Active Antiretroviral Therapy (HAART) in 1996, survival time increased significantly for all racial/ethnic groups, and continues to increase through the present, although disparities persist.

* The median survival time for American Indians and Asians may be artificially deflated due to the low number of American Indians and Asians diagnosed since 2007.

**Source: Florida Department of Health, Bureau of Communicable Diseases, HIV/AIDS Reporting System (as of 06/30/2015)
In 2013 HIV/AIDS was the 5th leading cause of death among blacks, 25 to 44 years of age.

(This rank has continued through 2014.)
In 2014, HIV/AIDS dropped from the second to the third leading cause of death for black females, 25 to 44 years of age.
Leading Causes of Death Among Blacks 25-44 Years Old by Sex, 2014, Florida

**Black Men**
HIV is 4th leading cause

**Black Women**
HIV is the 3rd leading cause
Impact of HIV Disease Among Blacks, by Country of Birth in Florida, Reported through 2014
Black Foreign-Born Adults Reported with HIV Disease by Country of Birth and Year of Report, 2005-2014, Florida

Note: Each year, the majority of black foreign born adults reported with HIV disease were Haitian born. Enhanced reporting laws were implemented in Nov. 2006, leading to an artificial spike in HIV infection cases between 2007 and 2008, then a subsequent artificial dip between 2008 and 2009.
Black Foreign-Born, Adult HIV Infection Cases, Known Dead, Regardless of Cause, by Country of Birth and Year of Death, 2005-2014, Florida

Note: Each year, the majority of black foreign born HIV/AIDS case deaths were Haitian born. Enhanced reporting laws were implemented in Nov. 2006, leading to an artificial spike in HIV cases between 2007 and 2008.

Number and Percentage of Persons Diagnosed and Living with HIV (PLWH) Engaged in Selected Stages of the Continuum of HIV Care Among Black Heterosexual Females, Florida, 2014

- 78% of those diagnosed with HIV in 2014 had documented HIV-related care within 3 months of diagnosis
- 77% of PLWH in care had a suppressed viral load in 2014

(1) HIV Diagnosed: Persons diagnosed and living with HIV (PLWH) in Florida through the end of 2014.
(2) Ever in Care: PLWH with at least 1 documented viral load (VL) or CD4 lab, medical visit or prescription since HIV diagnosis.
(3) In Care: PLWH with at least 1 documented VL or CD4 lab, medical visit or prescription in 2014.
Retained in Care: PLWH with 2 or more documented VL or CD4 labs, medical visits or prescriptions (at least 3 months apart) in 2014.
(4) On ART: This bar was omitted on tables with demographic and risk breakdowns because the estimated value is based on small numbers.
(5) Suppressed Viral Load: PLWH with a suppressed VL (<200 copies/mL) on last VL in 2014.
Underlying Factors Affecting HIV/AIDS Disparities

- Amount of HIV already in the community
- Late diagnosis of HIV or AIDS*
- Access to/acceptance of care*
- Stigma, denial*,
- Discrimination, homophobia*
- HIV/AIDS complacency*
- Poverty and unemployment

*Factors that HIV/AIDS initiatives can impact.
• Minorities are at high risk for HIV infection...
  • NOT because of their race
  • NOT because of their ethnicity...

• But BECAUSE of risk behaviors they may engage in.

  IT’S NOT WHO YOU ARE, BUT WHAT YOU DO.
